SKIN TRUE OR FALSE QUESTION SLIPS
Intro to Skin Health Handout, ages 11-13

INSTRUCTIONS: Cut along lines, fold each slip, and place in envelope/hat/bag for True or False Game.

1. The layers of the skin in order from top to bottom are: dermis, epidermis, and subcutaneous fat.

2. The epidermis layer gives skin color.

3. The subcutaneous fat layer acts like glue, connecting tissue to muscles and bone.

4. You have about 40,000 skin cells on your body.

5. Our skin makes sweat to keep our hair soft.

6. We have 650 sweat glands on our whole body.

7. The epidermis makes new cells, replacing the old ones that flake off.

8. The layer of skin with the oil shop is the epidermis.

9. The stored fat in the subcutaneous fat protects our body from bumps and bang ups.

10. Skin cells start out flat before they get fat and fall off.
