Contact dermatitis is among 24 skin diseases or disease categories examined in the Burden of Skin Disease report commissioned by the American Academy of Dermatology. The report examined prevalence, economic burdens, and mortality for skin disease in the U.S. using 2013 health care claims data drawn from insurance enrollment and claims databases and found that:

- **84.5 million Americans — one in four** — saw a physician for skin disease; 50% of them are over 65 and have an average of 2.2 skin conditions.
- Skin disease **cost the U.S. healthcare system $75 billion** in medical, preventative, and prescription and non-prescription drug costs.
- **One in three Americans with skin disease were seen by a dermatologist**, who collaborate with other physicians throughout the health care system in caring for these patients.

More than 13 million Americans sought medical treatment for contact dermatitis in 2013. The disease:

- Was **more prevalent in children**.
- Resulted in more than **$1.5 billion in medical treatment**, surpassing costs for melanoma treatment.
- Was among the **top 5 in terms of lost productivity**, with associated costs of $699 million in 2013.

The charts that follow provide topline data on how contact dermatitis contributes to the overall burden of skin disease.

The full report includes data on prescription and non-prescription drug costs, and how age and insurance status and provider relate to the burden associated with contact dermatitis and skin disease broadly. To purchase the report visit www.aad.org/BSD.
