Share the key takeaways and clinical pearls from your presentation with attendees.

**S010 - Lack of Uniformity in Inclusion Criteria for Clinical Trials of Atopic Dermatitis: A Systematic Review**

Rishi Chopra - MS3 - Stony Brook University School of Medicine

- **Takeaways:**
  - Poor documentation and heterogeneity of inclusion criteria and baseline severity.
  - Discordance between assessments used in inclusion criteria and baseline assessments.
  - Lack of uniformity may prevent the recruitment of patients representative of the intended target population, and thus, may limit the interpretability of trial results.
  - This heterogeneity should be considered when retroactively pooling results for AD RCT.

- **Pearls:**
  - Improve the documentation of AD severity measures used for inclusion criteria and baseline assessments.
  - Expand the use of patient-reported outcomes to assess baseline severity.
  - Harmonize the instruments used for inclusion in AD trials internationally for specific target populations.
