| **Session Number and Title:**  
  S023 - Hair and Scalp Dermoscopy  
  “Trichoscopy in Loose Anagen Hair Syndrome” |
| **Presenter Name:**  
  Norma Elizabeth Vázquez Herrera, M.D. |
| **Clinical Pearls:**  
  Loose anagen hair syndrome is due to a defective anchorage of the hair shaft to the follicle. Diagnosis is confirmed by the presence of more than 70% of anagen roots devoid of sheath at trichogram.  
  Trichoscopic features in this syndrome include:  
  • Rectangular granular black structures.  
  • Solitary yellow dots.  
  • An increased number of single hair units.  
  **Histological-Trichoscopic correlation:**  
  • Black structures may correspond to the remaining root sheath of the anagen follicle which has become rapidly empty.  
  • Solitary yellow dots correspond to empty follicles.  
  • Short regrowing hairs and piglet hairs correspond to new hair growth. |
