**Session Number and Title:**
S045 Pearls from the Posters
6187 - A clinicopathological study of 10 cases of eosinophilic annular erythema

**Presenter Name:**
Shinichi Nakazato, MD

**Clinical Pearls:**
* Eosinophilic annular erythema (EAE) has been proposed as a clinical entity to describe annular skin lesions associated with tissue eosinophilia. (1)
* Some EAE cases have been clinically documented as being accompanied by a dusky-toned area and pigmentation. (2-4)
* We retrospectively studied 10 cases of EAE at our hospital during a 5-year span.
* EAE is clinically characterized by central pigmentation reflecting basal melanosis.
* EAE should be included as a differential diagnosis of annular figurate erythema, even if there is no blood eosinophilia.
* Tissue eosinophilia confined to the dermis suggests a diagnosis of EAE.
* We recommend topical corticosteroids as the initial treatment for EAE.
